# 1 INTRODUCTION

## 1.1 SCOPE

The purpose of this document is to describe in detail the features and functions of the **ACS Smart Card Operating Systems Version 2 (ACOS2)** developed by Advanced Card Systems Ltd.

## 1.2 FEATURES

ACOS2 provides the following features:

- 8 Kbytes of EEPROM memory for application data
- Compliance with ISO 7816-1/2/3, T=0 protocol
- DES, Triple-DES and MAC capabilities
- Five secret codes + Issuer Code
- PIN, changeable by card holder
- Key pair for mutual authentication
- Session key based on random numbers
- Linear files with fixed record length; record length can be different for different files
- Account data structure for highly secure payment applications as an optional function

## 1.3 HISTORY OF MODIFICATION

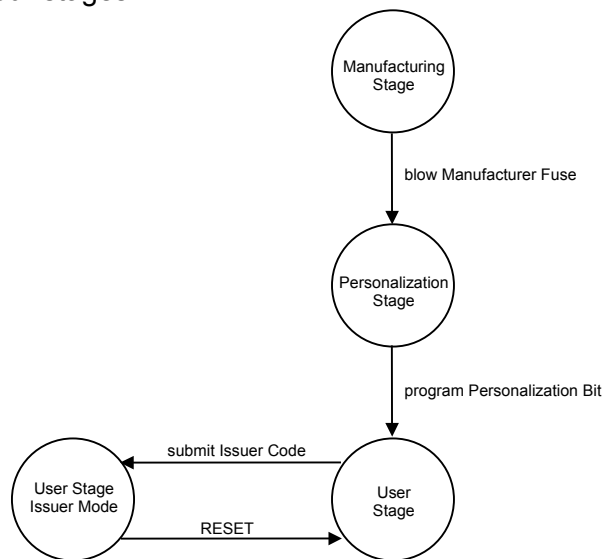

August 2004	ACOS2 revision 1.0
-------------	--------------------

## 2 CHIP LIFE CYCLE

During the whole life cycle of the chip-card, three phases and two different operating modes can be distinguished:

- Manufacturing Stage
- Personalization Stage
- User Stage
- User Stage - Issuer Mode

The card is at any moment in one of these four stages. The following diagram shows the possible transitions between the four stages:

The actual chip life cycle stage is determined by the card operating system immediately after a reset. The life cycle stage does not change during the operation of the card.

**NOTE: The CLEAR CARD command is no longer valid and hence there is no way for a smart card going from the user stage back to the personalization stage.**

### 2.1 MANUFACTURING STAGE

The Manufacturing Stage is effective from the moment of chip manufacturing until an associated fuse (i.e., a certain bit in the EEPROM), the so-called *Manufacturer Fuse*, has been programmed.

**\*\*\* The blowing of the Manufacturer Fuse is irreversible \*\*\***

**In the Manufacturing Stage, any write access to Internal Data Files, as well as the read access to the Security File is only possible after the presentation of the correct IC code. The initial IC code is programmed in the ACOS2 microcontroller during the chip manufacturing process.**

The IC is presented to the card in plain, without encryption.

All card commands are available, although some of the commands, such as AUTHENTICATE will not produce reasonable results as long as the respective data, for example, the keys, have not been programmed in the card.

The following data items are written to the EEPROM memory in the Manufacturing Stage:

- The Manufacturer File, containing **2** records of **8** bytes each associated to the Manufacturing Stage. This file can only be written in the Manufacturing Stage. After programming the Manufacturer Fuse, the Manufacturer File is read-only. Data unique to each card and common card data can be programmed, such as, card manufacturer identification, card serial number, etc. The card does not interpret the data.
- The IC code for the Personalization Stage.  
The IC code must have been presented to the card before the card allows WRITE access to the data files in the *Personalization Stage*, which is applicable immediately after completion of the Manufacturing Stage.
- The Manufacturer Fuse, to irreversibly change the card life cycle from the Manufacturing Stage to the Personalization Stage. The Manufacturer Fuse is one bit in the 16 bytes Manufacturer File.

## 2.2 PERSONALIZATION STAGE

The Personalization Stage is effective from the moment of termination of the Manufacturing Stage until an associated bit in the EEPROM, the so-called *Personalization Bit*, has been programmed.

Once the Personalization Bit has been programmed and the Personalization Stage has thus been terminated, the Personalization Stage can be entered again from the Issuer Mode by executing the *CLEAR CARD* command. This command will physically erase the EEPROM memory, except for the Manufacturer Area, and thus return the card to the status it had before the Personalization Bit was initially programmed. Note that the CLEAR CARD command is disabled and so there is no way for a card in Issuer Stage to get back to the Personalization Stage.

**In the Personalization Stage, any write access to Internal Data Files, as well as the read access to the Security File is only possible after the presentation of the correct IC code. The card manufacturer writes the IC code in the Manufacturing Stage.**

The IC is presented to the card in plain, without encryption. The Authentication Process should not be executed prior to programming the correct keys in the Personalization Stage.

The following data items are written to the memory in the Personalization Stage:

- The Personalization File, containing 3 records of 4 bytes each associated to the Personalization Stage, including the Option Registers. This area can only be written in the Personalization Stage. After programming the Personalization Fuse, the Personalization File is read-only. Data unique to each card and common card data can be programmed in the Personalization File, such as, card issuer identification, card application code, etc. The first 10 bytes of the Personalization File are transmitted in the Historical Bytes in the Answer-to-Reset.
- Secret Codes and Keys
- The File Definition Blocks of the required User Data Files.
- The Account Data Structure (if enabled by the respective option bit)
- The Personalization Bit to change the card life cycle from the Personalization Stage to the User Stage.

## 2.3 USER STAGE

*User Stage* designates the 'normal' operating mode of the card. The User Stage is effective from the moment of termination of the Personalization Stage until the so-called Issuer Code has been submitted to the card. A submission of the Issuer Code changes the operation mode to the so-

called Issuer Mode. This privileged mode allows access to certain memory areas, which are otherwise not accessible.

## 3 EEPROM MEMORY MANAGEMENT

The 8 k Bytes EEPROM memory area provided by the card chip is basically segregated in Internal Data Memory and User Data Memory:

- The Internal Data Memory is used for the storage of configuration data and it is used by the card operating system to manage certain functions.
- The User Data Memory stores the data manipulated in the normal use of the card under control of the application.

### 3.1 DATA FILES

Access to both the Internal Data Memory area and the User Data Memory area is possible within the scopes of data files and data records. Data files in the Internal Data Memory are referred to as *Internal Data Files*. Data files in the User Data Memory are called *User Data Files*.

Data files are the smallest entity to which individual security attributes can be assigned to control the read and write access to the data stored in the EEPROM.

Data files are composed of data records. A data record is the smallest data unit that can individually be addressed in a data file. Each data file contains N data records. The record number must be specified when a record (or data within a record) is read from or written to a file. A data file can contain up to 255 records. The record length can be different for different files but is always fixed within a file.

The file structures of the Internal Data Files (file size, file identifier, record length, security attributes) are defined by the operating system and cannot be changed. The file structure for the User Data Memory is determined in the card personalization. After programming the parameter N\_OF\_FILE in the Personalization Stage, the file structure is fixed.

Access to all files is possible only through the READ RECORD and WRITE RECORD commands. The operating system does not keep track of which records have actually been written through the WRITE RECORD command. The data returned by the card in response to a READ RECORD command are the actual data read from the EEPROM memory, regardless of whether that data have ever been written.

Each file is identified by two bytes File Identifier. The File Identifier is assigned to the file when the file is being defined during the Personalization Stage. The operating system does not perform any checking on the uniqueness of each File Identifier. If the same identifier has been assigned to more than one file, a malfunction of the card may occur.

**A value of FF<sub>H</sub> of the first byte of the file identifier is used for Internal Data Files and cannot be used for User Data Files.**

Before any READ RECORD or WRITE RECORD access to a file, the file must be opened through the SELECT FILE command. Only one file is selected at any time. The READ RECORD and WRITE RECORD commands refer to the most recently selected file.

### 3.2 DATA FILE ACCESS CONTROL

Two security attributes are assigned to each Data File: the Read Security Attribute and the Write Security Attribute. Security attributes define the security conditions that must be fulfilled to allow the respective operation:

- The Read Security Attribute controls the read access to the data in a file through the READ RECORD command. If the security condition specified in the Read Security Attribute is not fulfilled, the card will reject a READ RECORD command to that file.
- The Write Security Attribute controls the write access to the data in a file through the WRITE RECORD command. If the security condition specified in the Write Security Attribute is not fulfilled, the card will reject a WRITE RECORD command to that file.

The Read Security Attribute and the Write Security Attribute for each data file specify which Application Code, if any, must have been submitted correctly to the card to allow the respective operation, and whether the Issuer Code and/or the PIN code must have been submitted.

A logical OR function applies to the specified Application Codes, AC x, i.e., if more than one Application Code is specified in a security attribute, the security condition is fulfilled if any one of the specified Application Codes has been correctly submitted.

A logical AND function applies to the PIN and the IC code, i.e., if PIN and/or IC are specified in a security attribute, the PIN and/or IC code(s) must have been submitted in addition to the specified Application Codes(s).

**Application Code AC0 can be specified in the Security Attribute, but cannot be submitted to the card. It is thus possible, for example, to completely write protect a file by specifying AC0 in the Write Security Attribute of that file.**

For Internal Data Files, the security attributes are fixed in the card operating system. For User Data Files, the security attributes of a file are stored in the associated File Definition Block.

The following table lists examples of security conditions that can be specified for User Data Files:

Security Attribute	Security Condition
-	No restriction; free access
AC x	Access only after correct submission of AC x
AC x, AC y, AC z	Access only after correct submission of AC x <b>or</b> AC y <b>or</b> AC z
IC	Access only after submission of IC
PIN	Access only after submission of PIN
PIN, IC	Access only after submission of PIN <b>and</b> IC
AC x, IC	Access only after submission of AC x <b>and</b> IC
AC x, PIN, IC	Access only after submission of AC x, <b>and</b> PIN <b>and</b> IC
AC x, AC y, PIN	Access only after correct submission of AC x <b>or</b> AC y, <b>and</b> PIN
AC0	No access

AC x       requires Application Code x  
 PIN        requires PIN code  
 IC         requires Issuer Code

A Security Attribute is defined in one byte as follows:

Each bit of the byte represents a code. If the bit is set to '1', the corresponding code must have been submitted. If the bit is set to '0', the corresponding code is irrelevant for the access condition.

### 3.3 INTERNAL DATA FILES

With exception of the Account Data Structure, which has associated a special set of commands, the memory areas of the Internal Data Memory are processed as data files.

The attributes of the Internal Data Files are defined in the card operating system and cannot be changed. However, the security attributes depend on the card life cycle stage.

The following Internal Data Files are defined:

Memory Area	Internal File ID	File Security Attributes			Record Organization
		Manufacturing Stage	Personalization Stage	User Stage	
MCU-ID File	FF 00 <sub>H</sub>	R: FREE W: NO ACCESS	R: FREE W: NO ACCESS	R: FREE W: NO ACCESS	2 x 8 bytes
Manufacturer File	FF 01 <sub>H</sub>	R: FREE W: IC	R: FREE W: NO ACCESS	R: FREE W: NO ACCESS	2 x 8 bytes
Personalization File	FF 02 <sub>H</sub>	R: FREE W: IC	R: FREE W: IC	R: FREE W: NO ACCESS	3 x 4 bytes
Security File	FF 03 <sub>H</sub>	R: IC W: IC	R: IC W: IC	R: NO ACCESS W: IC	12 x 8 bytes
User File Management File	FF 04 <sub>H</sub>	R: FREE W: IC	R: FREE W: IC	R: FREE W: IC	N_OF_FILE x 6 bytes
Account File	FF 05 <sub>H</sub>	R: FREE W: IC	R: FREE W: IC	R: IC W: IC	8 x 4 bytes
Account Security File	FF 06 <sub>H</sub>	R: FREE W: IC	R: FREE W: IC	R: NO ACCESS W: IC	4 x 8 bytes
User File Data Area	file IDs: xx yy <sub>H</sub>  xx ≠ FF <sub>H</sub>	according to the file definitions			

### 3.3.1 MCU ID File

The MCU ID File contains two records of eight bytes each. The contents of this file are determined during the chip manufacturing process and cannot be altered.

This file is always free for READ access but not WRITE accessible.

### 3.3.2 Manufacturer File

The Manufacturer File comprises two records of eight bytes each that are written in the Manufacturing Stage of the card life cycle. After termination of the Manufacturing Stage, this file is read-only and free for READ access.

The termination of the Manufacturer Stage is indicated by writing a '1' into the MSB of byte 1 of the first record in the Manufacturer File (Manufacturer Fuse). After the next reset of the card, the Manufacturing Stage can never again be entered.

Manufacturer File, first record:

Only the bits in M, A, B are interpreted by the operating system.

INQ\_ACC\_MAC flag affects the INQUIRY ACCOUNT command only. A one in this flag makes the composition of the MAC calculation including the credit and debit transaction reference. Please refer to the section of INQUIRY ACCOUNT for the details.

RECORD\_NUMBERING flag affects the record numbering system of the whole card. This flag when one indicates that the records are numbered from 1 to N, a zero in this flag indicates that the records are numbered from 0 to N-1 (where N is the number of records in the file).

**NOTE: In ACOS2 smart cards and smart card modules (chip-on-board), the Manufacturer File normally is written and the Manufacturer Fuse programmed by ACS before the devices are being shipped. Hence, the card issuer normally has no control over the contents of the Manufacturer File.**

**NOTE: The INQ\_ACC\_MAC flag and the RECORD\_NUMBERING flag are pre-set by ACS according to the compatibility requirement and they are not changeable by the card issuer.**

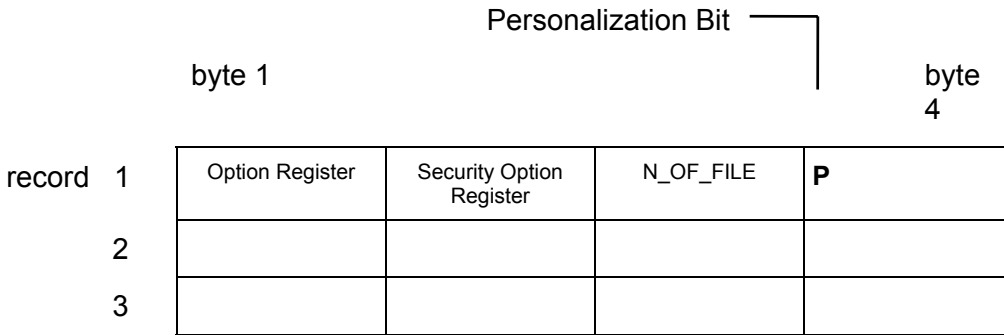

### 3.3.3 Personalization File

The Personalization File comprises 12 bytes, arranged as 3 records of 4 bytes each.

The Personalization File is written during the Personalization Stage of the card life cycle. After termination of the Personalization Stage, this file is read-only and free for READ access.

The termination of the Personalization Stage is indicated by writing a '1' into the MSB of byte 4 of the first record in the Personalization File (Personalization Bit). The change of stage will be effective immediately after the next reset of the card.

Personalization File:

The first three bytes of the first record of the Personalization File are used to set certain parameters and to enable/disable optional features of the card operating system:

Byte 1 is called the *Option Register* and contains five option bits:

- ACCOUNT** This bit indicates whether the Account Data Structure is available in the card. If the bit is not set, indicating that the Account Data Structure is not present, the memory space required for storing the Account Data Structure and the associated security data is available for User Data Files and the Account processing commands cannot be executed.
- 3-DES** This bit indicates whether the encryption is DES or 3-DES. If the bit is not set, single DES will only be performed. If the bit is set, triple DES is only supported.
- PIN\_ALT** This bit determines whether the PIN code can be changed through the CHANGE PIN command. If the bit is set, the PIN code can be changed after it has successfully been submitted to the card.
- DEB\_MAC** This bit indicates whether the DEBIT transaction must be authenticated by a MAC cryptographic checksum (see 'DEBIT'). If the bit is not set, the card does not evaluate the data transmitted as MAC checksum in the DEBIT command.
- DEB\_PIN** This bit indicates whether the PIN code must be submitted for the DEBIT command. If the bit is set, the DEBIT command is only carried out after the PIN code has successfully been submitted to the card (see 'DEBIT').
- REV\_DEB** This bit determines whether the card can execute the REVOKE DEBIT command. If the bit is not set, the card will reject the REVOKE DEBIT command. (see 'REVOKE DEBIT')
- TRNS\_AUT** This bit determines whether the Account Transaction processing requires the previous completion of the mutual authentication process, and the use of the current Session Key in the computation of the MAC cryptographic checksums. If the bit is set, the mutual authentication must have been executed prior to any Account Transaction command and the MAC cryptographic checksum must be DES encrypted with the current session key before it is sent to the card.

**INQ\_AUT** This bit determines whether the INQUIRE ACCOUNT command requires the previous completion of the mutual authentication process, and the use of the current Session Key in the computation of the MAC cryptographic checksum returned by the card in response to this command. If the bit is set, the mutual authentication must have been executed prior to the execution of the INQUIRE ACCOUNT command and the MAC cryptographic checksum is DES encrypted with the current session key before it is returned by the card.

**NOTE:** By enabling the options controlled by the bits TRNS\_AUT and INQ\_AUT, a *Unique Key per Transaction* scheme can be used with the Account transaction processing. This provides a very high security level.

Byte 2 is called the *Security Option Register* and contains seven option bits:

These bits specify for the corresponding Secret Codes (IC, PIN, AC1...AC5), whether the codes are presented to the card in plain or encrypted. If a bit is set to '1', the corresponding code submitted in the SUBMIT CODE command must be encrypted with the current session key before it is presented to the card. This means, the Mutual Authentication as described later in this document must have been completed.

If a bit is set to '0', the corresponding code is submitted in plain without encryption.

The bit PIN\_DES also determines whether encryption is used with the CHANGE PIN command. If the bit is set, the new PIN code must be encrypted with the current session key before it is submitted in the CHANGE PIN command.

**For security reasons it is highly recommended that in any application the IC must be submitted in encrypted form in the User Stage!**

**NOTE:** The *Option Register* and the *Security Option Register* are evaluated by the ACOS2 operating system only after a card reset. After changing any option bit during the card personalization, a card reset must be performed in order for the change to take effect.

Byte 3:

**N\_OF\_FILE** This value specifies the number of data files allocated in the File Data Area. The card operating system expects that accordingly N\_OF\_FILE File Definition Blocks have been written as records in the User File Management File.

**The maximum value for this parameter is 31, allowing for maximum 31 User Data Files to be defined. ACOS 2 processes only the least significant 5 bits of the value in this byte.**

Only the Option Registers and the bit of the Personalization Fuse are interpreted by the card operating system.

The first 8 bytes (2 records) of the Personalization File are transmitted in the Historical Bytes in the Answer-To-Reset.

### 3.3.4 Security File

The Security File stores the following information:

- The key pair used for card authentication.
- The five Application Codes used for the file access control.
- The Issuer Code IC.
- The PIN code.
- Error counters for limiting the number of unsuccessful code presentations and authentication.
- The seed for the random number generator.

The Security File can only be read during the Manufacturing Stage and the Personalization Stage of the card life cycle, after presentation of the correct IC.

**\*\*\* After termination of the Personalization Stage, there is NO possibility to read the Security File.**

The Security File can be written in the Manufacturing Stage and in the Personalization Stage after presentation of the correct IC, and in the Issuer Mode of the User Stage.

Upon the execution of the CLEAR CARD command in the Issuer Mode (only available in revision 1.0), the Security Area will be erased by the operating system.

The Security File comprises 14 records of 8 bytes length each and is organized as follows:

Security File:

byte 1		byte 8														
record 1	Issuer Code IC															
2	PIN															
3	Authentication Card Key $K_C$															
4	Authentication Terminal Key $K_T$															
5	Random Number Seed for $RND_C$															
6	Application Code AC1															
7	Application Code AC2															
8	Application Code AC3															
9	Application Code AC4															
10	Application Code AC5															
11	CNT AC1		CNT AC3	CNT AC2	CNT AC5	CNT AC4	CNT IC	CNT PIN		CNT $K_T$			CNT $K_{id}$	CNT $K_d$		CNT $K_{cr}$
12	CNT' AC1		CNT' AC3	CNT' AC2	CNT' AC5	CNT' AC4	CNT' IC	CNT' PIN		CNT' $K_T$			CNT' $K_{id}$	CNT' $K_d$		CNT' $K_{cr}$
13	Right half of 3-DES Authentication Card Key $K_C$															
14	Right half of 3-DES Authentication Terminal Key $K_T$															

CNT xxx = Counter for the successive submission of wrong key / code xxx

CNT' xxx = Backup copy of respective counter value

**NOTE: The records #11 and #12 storing CNT xxx and CNT' xxx must not be written in the card personalization. Inadvertently writing a wrong value to these records may permanently lock the card and render it useless!**

**NOTE: Record numbers 13 and 14 are available in version 3.0 only. The right half of the authentication keys is stored here. When single DES option is selected, these are not used but present.**

### 3.3.5 Account File

The Account File stores the Account Data Structure used for highly secure payment applications.

If the option bit ACCOUNT in the option registers is not set, this file is not processed by the card operating system and the memory space is available for User Data Files.

The Account File can be written during the Manufacturing and Personalization Stage of the card life cycle after presentation of the correct IC code. After Termination of the Personalization Stage, this file can be written after the Issuer Code has been submitted.

The Account File contents are explained in detail in section 4. *Account Transaction Processing*.

### 3.3.6 Account Security File

The Account Security File stores the four secret keys used for the calculation of the MAC cryptographic checksums used in connection with the Account processing commands.

The Account Security File can only be read during the Manufacturing Stage and the Personalization Stage of the card life cycle.

**\*\*\* After termination of the Personalization Stage, there is NO possibility to read the Account Security File.**

The Account Security File can be written in the Manufacturing Stage and in the Personalization Stage after presentation of the correct IC code, and in the Issuer Mode.

If the option bit ACCOUNT in the option registers is not set, this file is not processed by the card operating system and the memory space is available for storage User Data Files.

The Account Security File contents are explained in detail in section 4. *Account Transaction Processing*.

### 3.3.7 User File Management File

The User File Management File consists of N\_OF\_FILE records of 6 bytes each and stores a File Definition Block for an allocated User Data File in each record.

The File Definition Blocks are written during the Personalization Stage of the card life cycle. After termination of the Personalization Stage, this file is free for read access and can be written after the Issuer Code has been submitted.

The sequence of File Definition Blocks in the User File Management Area is not relevant. When the SELECT FILE command is issued, the card operating system searches all File Definition Blocks for one whose File Identifier entry matches the value specified in the SELECT FILE command.

The Card Operating System does not provide any error checking on the File Definition Blocks nor does it check the consistency of the number of file definition blocks written with the parameter N\_OF\_FILE. Any inconsistency of these data can lead to a malfunction of the card.

### 3.3.8 User File Data Area

The User File Data Area stores the data written to the User Data Files. Security attributes are attached to User Data Files, which control the access to the data in the files.

User Data Files cannot be deleted. Once allocated, the memory space for a User Data File is reserved and cannot be released when the file is no longer used.

## 3.4 USER DATA FILES

User Data Files are allocated in the Personalization Stage of the card life cycle. The data stored in a User Data File can be read through the READ RECORD command and updated through the WRITE RECORD command when the security conditions associated to the data file are fulfilled.

User Data Files are defined by writing the corresponding File Definition Blocks in the records of the User File Management File during the Personalization Stage. It is not possible to change the number of records of a file once any of the User Data Files has been used.

A User Data File can contain up to 255 records of max. 32 bytes record length each.

### 3.4.1 Memory space for User Data Files

The available memory space for User Data Files depends on whether or not the Account Data Structure is required. If the option bit ACCOUNT is set, the Account Data Structure reduces the memory space available for User Data Files by 64 bytes or 96 bytes, depending on Single DES or Triple DES is selected, respectively.

For maximum flexibility, the memory space occupied by the User File Management File is not fixed but depends on the number of User Data Files. Therefore, the amount of memory space available for User Data Files also depends on the number of files. Some memory space is required for each file for the internal management by the operating system.

Available memory space for User Data Files:

Size	Account Data Structure not available (ACCOUNT = 0)	Account Data Structure available with 1-DES (3-DES=0 and ACCOUNT = 1)	Account Data Structure available with 3-DES (3DES=1 and ACCOUNT = 1)
<b>No of Files even</b>	7964 - N*6	7900 - N*6	7868 - N*6
<b>No of Files odd</b>	7962 - N*6	7898 - N*6	7866 - N*6

N = number of User Data Files defined

**NOTE: All user files occupy multiple of 4 bytes.** (Including User File Management File)

The size of a User Data File is calculated as **Number of Records \* Record length (bytes)**, adjusted to next higher multiple of 4 bytes. The amount of memory space occupied by all User Data Files is the sum of the individual file sizes. (To utilize full memory use #files, #records and record size all even)

**NOTE: Care must be taken by the card issuer to assure that the memory space allocated for all User Data Files does not exceed the available memory space! ACOS2 does not check the allocation of User Data Files against the available memory space and exceeding the above limits can lead to a malfunction of the card!**

### 3.4.2 User File Definition Block

Each User Data File is described in an associated File Definition Block which contains the file identifier, record length, file length and security attributes. Each File Definition Block comprises six (6) bytes:

byte 1	byte 2	byte 3	byte 4	byte 5 / 6
Record length	Number of Records	Read Security Attribute	Write Security Attribute	File identifier

The File Definition Blocks of all files are stored in the User File Management File. They can be read through READ RECORD commands after selection the User File Management File with the SELECT FILE command.

The number of records in the User File Management File is given by the value of the parameter N\_OF\_FILE in the option register.

### 3.4.3 User File Allocation

For the allocation of User Data Files in a new card, follow the steps as listed below. It is assumed that the IC has been presented to the card prior to this operation such that the Internal Data Files can be written.

1. Use the SELECT FILE command with file ID = FF02 to select the Personalization File.
2. Write the number of User Data Files required to the option register N\_OF\_FILE, which is the third byte of the first record of the Personalization File, to allocate the required space (number of records) in the User File Management File.
3. Use the SELECT FILE command with file ID = FF04 to select the User File Management File.
4. Write the N\_OF\_FILE file definition blocks to the User File Management File with the WRITE RECORD command. Write the six bytes of each File Definition Block at once.
5. Now the User Data Files can be selected and read and written.

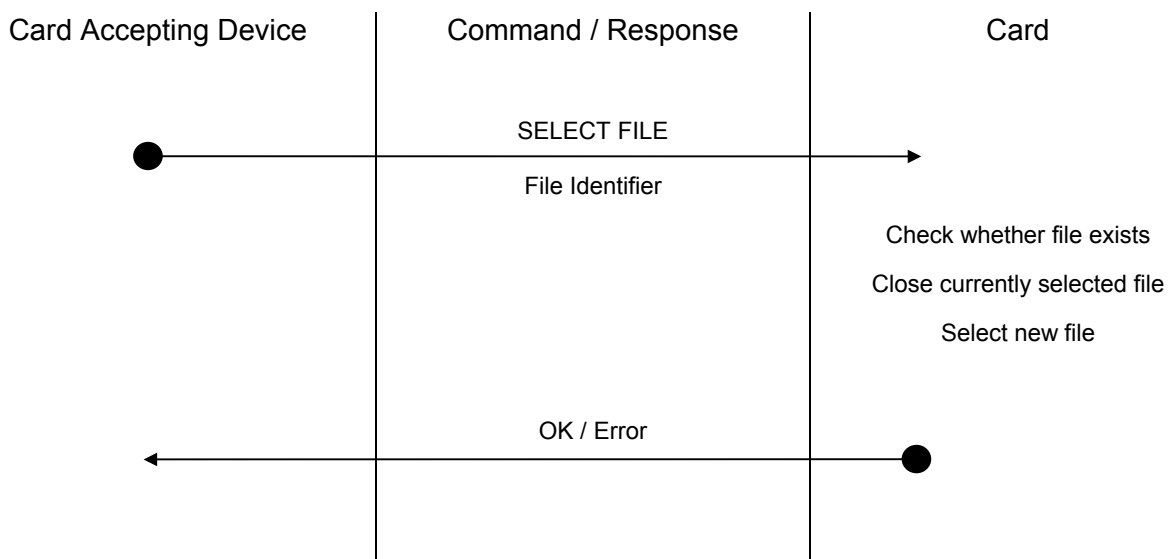

## 3.5 DATA FILE ACCESS

The process of data file access is identical for Internal Data Files and for User Data Files.

### 3.5.1 SELECT FILE

The SELECT FILE command can be executed any time. The specified file - if existent - will be selected and the previously selected file - if any - will be closed. If the specified file does not exist, the card returns an error code and does not change the status of a currently selected file. The security conditions specified for the newly selected file are not checked in the SELECT FILE processing and the Mutual Authentication need not be completed prior to the execution of the SELECT FILE command. After a card reset, no file is selected.

The SELECT FILE command is carried out as follows:

**File Identifier** Two bytes file identifier of the file to be selected

### 3.5.2 READ RECORD

The READ RECORD command can be executed once a file has been selected through the SELECT FILE command.

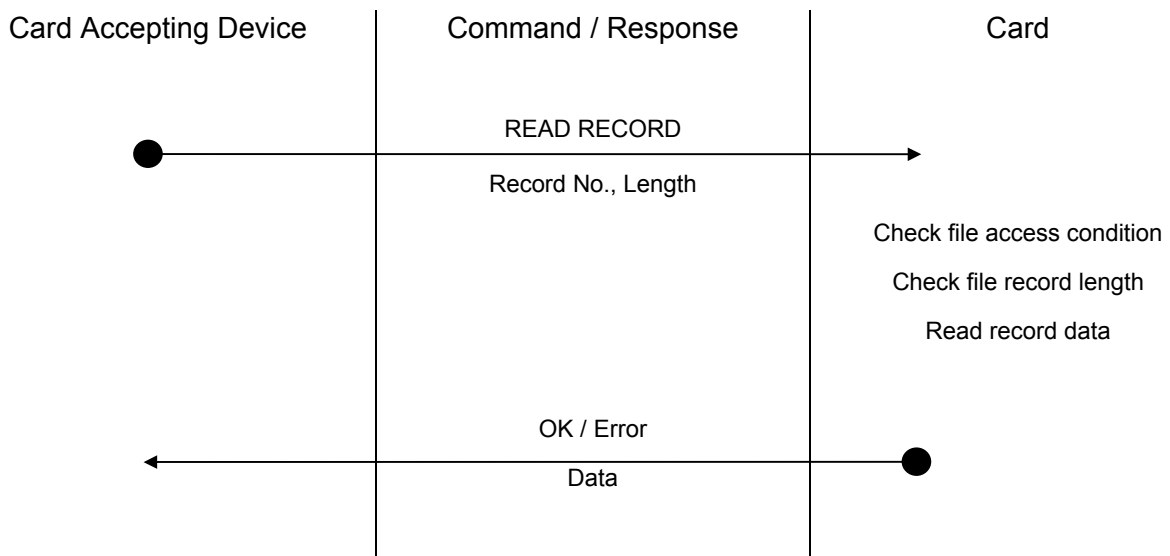

The security conditions associated to the currently selected file are checked prior to the execution of the command by the card. If the security conditions are not fulfilled (i.e., the specified secret codes have not been submitted to the card), the command is rejected by the card.

Data from only one record can be read in each READ RECORD operation. The number of bytes to be read is specified in the command.

The maximum number of bytes to be read is equal to the record length.

If the number of bytes read (= N) is smaller than the record length, the first N bytes of the record are returned by the card.

The READ RECORD command is carried out as follows:

- Record No.      One byte logical record number
- Length          Number of data bytes to be read from the record, max. 32
- Data            Record data, *Length* bytes

### 3.5.3 WRITE RECORD

The WRITE RECORD command can be executed once a file has been selected through the SELECT FILE command.

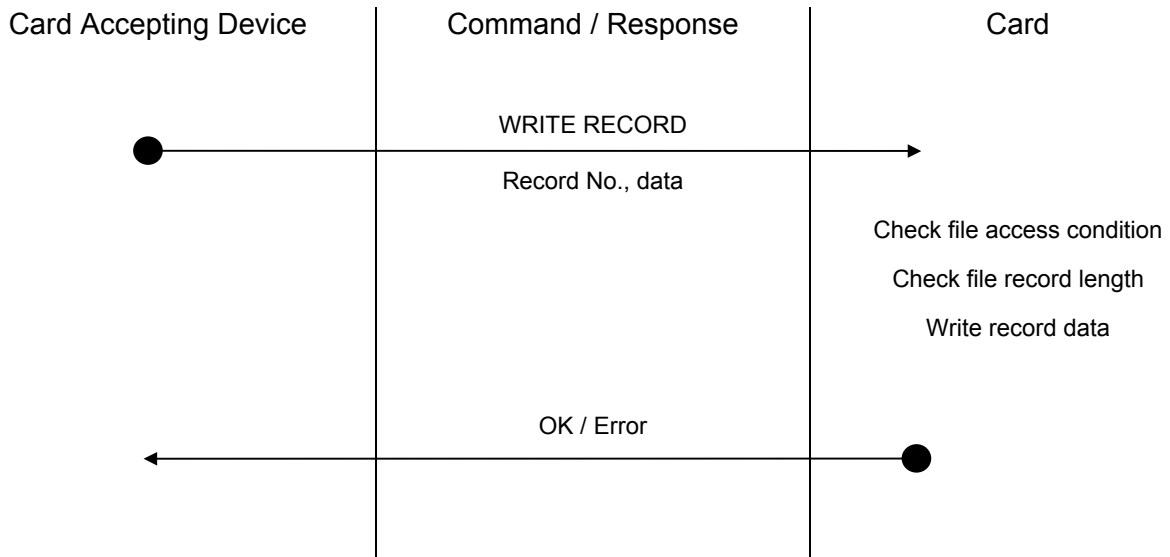

The security conditions associated to the currently selected file are checked prior to the execution of the command by the card. If the security conditions are not fulfilled (i.e., the specified secret codes have not been submitted to the card), the command is rejected by the card.

Data can be written to only one record in each WRITE RECORD operation. The number of bytes to be written in the record is specified in the command.

The maximum number of bytes to be written is equal to the record length.

If the number of bytes to be written (= N) is smaller than the record length, the first N bytes of the record are overwritten with the new data. The remaining bytes in the record are not modified.

The WRITE RECORD command is carried out as follows:

- Record No.      One byte logical record number
- Data            Data bytes to be written to the record

### 3.6 ACCOUNT DATA STRUCTURE

The Account Data Structure - *Account*, for short - is dedicated for the use in applications in which a numeric value representing some 'amount' must be securely processed. The Account is stored in the Account File.

In the User Stage of the card life cycle, the data in the Account cannot be manipulated by WRITE instructions like the data in User Data Files. A set of dedicated instructions is available for the processing of the Account, i.e. for adding value to and subtracting value from the balance in the Account and for reading the current balance.

Different access conditions can be specified for adding to, subtracting from and reading the Account.

Critical Account operations, for example, CREDIT, are carried out under strict security control conditions, as explained below in 'Account Transaction Processing'.

The Account Data Structure in the Account File has the following form:

	byte 1		byte 4
record 1	TRANSTYP 0	BALANCE 0	
2	ATC 0	CHKSUM 0	00
3	TRANSTYP 1	BALANCE 1	
4	ATC 1	CHKSUM 1	00
5	MAXBAL		00
6	AID		
7	TTREF_C		
8	TTREF_D		

- TRANSTYP** Together with the balance values is stored the type of transaction that resulted in that balance value. This information is updated when the balance value is updated. The following transaction types are distinguished: CREDIT, DEBIT, REVOKE DEBIT.
- BALANCE** Balance value is three bytes long, can store a value of up to 16.8 Mio. Only positive integer values are possible for the Balance.
- ATC** The Account Transaction Counter ATC is incremented before each transaction to give a unique electronic signature for each transaction. Together with the Account ID AID, the ATC builds the Account Transaction reference ATREF, which is used in the calculation of MAC cryptographic checksums to certify the execution of Account related commands by the card. When ATC reaches its maximum value (FF FF<sub>HEX</sub>), the operating system does not allow any further transaction.
- CHKSUM** The checksum is the least significant byte of the algebraic sum of the bytes of TRANSTYP, BALANCE and ATC, plus one.
- MAXBAL** The Maximum Balance value is checked by the operating system when a CREDIT transaction is performed. If the sum of current balance plus the amount to be credited exceeded the Maximum Balance value, the card will reject the CREDIT command.
- AID** The Account Identification is a four bytes value that is combined with the Account Transaction Counter (ATC) to give the six bytes ATREF:

The AID is written once in the Personalization Stage of the card life cycle. It is never modified.

- TTREF-C** The Terminal Transaction Reference - Credit is provided by the Card Accepting Device when a CREDIT transaction is executed. It is only stored but not interpreted

by the card. The Card Accepting Devices can evaluate this information, for example, to reject a card that has been credited by an unauthorized terminal.

**TTREF-D** The Terminal Transaction Reference - Debit is provided by the Card Accepting Device when a DEBIT or REVOKE DEBIT transaction is executed. The TTREF-D is stored in the Account when a DEBIT transaction is executed. The REVOKE DEBIT command will only be executed if the TTREF-D submitted with the command is identical with the stored TTREF-D. This identity proves that the same terminal that issued the preceding DEBIT command issued the REVOKE DEBIT command.

TRANSTYP, BALANCE and ATC are stored two times to prevent a loss of this important information when a power-fail or a card reset occurs during a transaction. The larger of the two ATC values in the account indicates the data set used in the most recent transaction.

The checksum is used to verify the integrity of the data in the Account. The checksum is calculated when the account data are updated in a transaction. The checksum is verified by the card operating system before any transaction is executed.

**NOTE: If the checksum is found incorrect, the card allows the execution of transactions only in the Issuer Mode, i.e., after the submission of the Issuer Code IC.**

### 3.6.1 Account Processing Keys

The encryption keys used in the computation of MAC cryptographic checksums with the Account processing are stored as records in the Account Security File as follows:

#### Key storage for Single DES

Record No	Byte 1							Byte 8
1	K <sub>D</sub>							
2	K <sub>CR</sub>							
3	K <sub>CF</sub>							
4	K <sub>RD</sub>							

- K<sub>D</sub> The DEBIT key, used in the computation of the MAC for the DEBIT command
- K<sub>CR</sub> The CREDIT key, used in the computation of the MAC for the CREDIT command
- K<sub>CF</sub> The CERTIFY key, used in the computation of the MAC with the INQUIRE ACCOUNT command
- K<sub>RD</sub> The REVOKE DEBIT key, used in the computation of the MAC for the REVOKE DEBIT command

NOTE: keys are 8-byte long

**Key storage for Triple DES**

Record No	byte 1							byte 8
1	Right half of $K_D$							
2	Right half of $K_{CR}$							
3	Right half of $K_{CF}$							
4	Right half of $K_{RD}$							
5	Left half of $K_D$							
6	Left half of $K_{CR}$							
7	Left half of $K_{CF}$							
8	Left half of $K_{RD}$							

$K_D$  The DEBIT key, used in the computation of the MAC for the DEBIT command

$K_{CR}$  The CREDIT key, used in the computation of the MAC for the CREDIT command

$K_{CF}$  The CERTIFY key, used in the computation of the MAC with the INQUIRE ACCOUNT command

$K_{RD}$  The REVOKE DEBIT key, used in the computation of the MAC for the REVOKE DEBIT command

Note: keys are 16-byte long

## 4. SECURITY ARCHITECTURE

The following security mechanisms are provided by the ACOS2 card operating system:

- DES and MAC calculation
- Mutual Authentication and Session Key based on Random Numbers
- Secret Codes
- Secure Account Transaction Processing

DES refers to the DEA algorithm for data encryption and decryption as specified in the standard ANSI X3.93. MAC refers to the algorithm for the generation of cryptographic checksums (DEA in Cipher Block Chaining mode) as specified in the standard ANSI X3.93.

Mutual Authentication is a process in which both the card and the Card Accepting Device verify that the respective counterpart is genuine. The Session Key is a result of the successful execution of the Mutual Authentication. It is used for data encryption and decryption during a 'session'. A session is defined as the time between the successful execution of a Mutual Authentication procedure and a reset of the card or the execution of another START SESSION command.

Secret Codes and the PIN code are used to selectively enable access to data stored in the card and to features and functions provided by the card, for example, the READ and WRITE commands.

The Account Transaction Processing provides mechanism for the secure and auditable manipulation of data in the Account Data Structure, in particular, the balance value.

### 4.1 DES AND MAC CALCULATION

All keys used in DES and MAC calculation are 8 / 16 bytes long depending on Single / Triple DES selection in *Option Register*. The most significant bit of each byte of the key is not used in the calculation and is not interpreted by the card operating system.

### 4.2 MUTUAL AUTHENTICATION AND SESSION KEY BASED ON RANDOM NUMBERS

The Mutual Authentication is based on the exchange and mutual verification of secret keys between the Card and the Card Accepting Device. The key exchange is performed in a secure way by use of random numbers and DES data encryption.

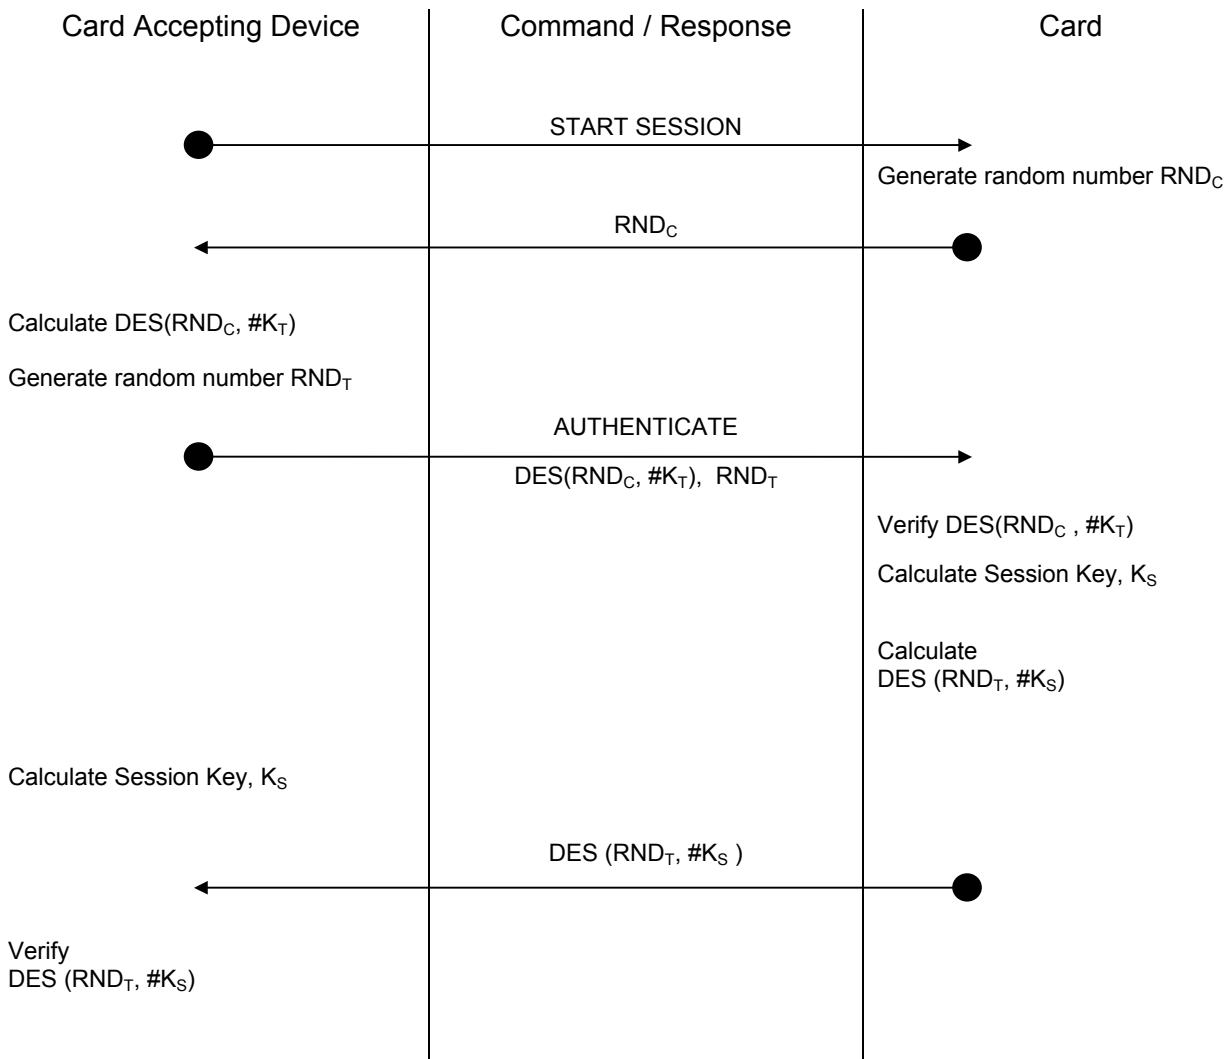

ACOS2 maintains a dedicated pair of data encryption/decryption keys for the Mutual Authentication,  $K_T$ , called *Terminal Key*, and  $K_C$ , called *Card Key*.

ACOS2 also provides a generator for the random numbers used in the Mutual Authentication process,  $RND_C$ , called *Card Random Number*.

The session key is the final result of the Mutual Authentication process.

The Mutual Authentication process is carried out as follows:

**NOTE:** DES shall be 1-DES or 3-DES depending on *Option*

Calculation of Session Key  $K_S$  also depends on the encryption selected.

If single DES option has been selected

$$K_S = 1\text{-DES}(1\text{-DES}(RND_C, \#K_C) \oplus RND_T, \#K_T)$$

If Triple DES option has been selected,

$$\text{Left half of } K_S = 3\text{-DES}(3\text{-DES}(RND_C, \#K_C), \#K_T) \ \& \ \text{Right half of } K_S = 3\text{-DES}(RND_T, \#(\text{reverse } K_T)),$$

where,  $\#(\text{reverse } K_T)$  is obtained by exchanging the Left and Right half of  $K_T$

- RND<sub>C</sub>            Eight bytes random number generated by the Card
- RND<sub>T</sub>            Eight bytes random number generated by the Card Accepting Device
- K<sub>C</sub>                Card Key
- K<sub>T</sub>                Terminal Key
- K<sub>S</sub>                Session Key

The successful completion of the Mutual Authentication is recorded in the card. The resulting Session Key  $K_S$  is used for all data encryption and decryption during the same session.

The Mutual Authentication between Card and Card Accepting Device must be completed in the specified order. If any other card command is sent to the card interrupting the Mutual Authentication procedure as specified above, the card will abort the Mutual Authentication process and erase any intermediate data resulting from the preceding Mutual Authentication commands. The terminal must restart the complete Mutual Authentication procedure from the START SESSION command.

If after a successfully completed Mutual Authentication procedure the card receives the START SESSION command, it erases the previous session key and the complete Mutual Authentication procedure must be repeated to define a new session key. The current security status of the card will be maintained, i.e., Secret Codes that have successfully been submitted to the card need not be submitted again.

The card maintains an error counter  $CNT K_T$  to count and limit the number of consecutive unsuccessful executions of the AUTHENTICATE command:

- The error counter is incremented by one each time the AUTHENTICATE operation fails, i.e., a wrong  $K_T$  is presented to the card.
- The error counter is reset when the AUTHENTICATE operation is successful.
- If the error counter reaches a value of 8 (eight), the card will not execute the command AUTHENTICATE any longer. In this case, all related security mechanisms (e.g., the submission of Secret Codes) are blocked. **This condition is irreversible and can render the card unusable.**

The error counter is stored in the Security File. The value of the counter is returned in the card response if a wrong  $K_T$  is used in the AUTHENTICATE command.

The Card Random Number  $RND_C$  is derived in a complex non-predictable mathematical process from the Random Number Seed stored in the Security File. The Random Number Seed is internally updated by the Operating System after each START TRANSACTION command.

## 4.3 SECRET CODES

Secret codes stored in the card are used to restrict the access to data stored in user data files and to certain commands provided by the card. Secret codes must be presented to the card in order to be able to read data from or write data to user data files and to execute certain privileged card commands.

ACOS2 provides the following secret codes:

- Five Application Codes (AC)
- One Issuer Code (IC)
- One PIN Code (PIN)

### 4.3.1 Application Codes

Five Application Codes (AC1 .. AC5) are available to control the access to the data stored in data files. Each Application Code is eight bytes long.

An option bit in the Security Option Register in the Personalization File specifies for each code whether the code must be submitted to the card in plain or encrypted with the current session key.

### 4.3.2 Issuer Code

The Issuer Code is provided to control access to data files and to privileged card functions; it is eight bytes long.

An option bit in the Security Option Register in the Personalization file specifies for the IC whether it must be submitted to the card in plain or encrypted with the current session key.

### 4.3.3 PIN code

The PIN Code is provided to control access to data files.

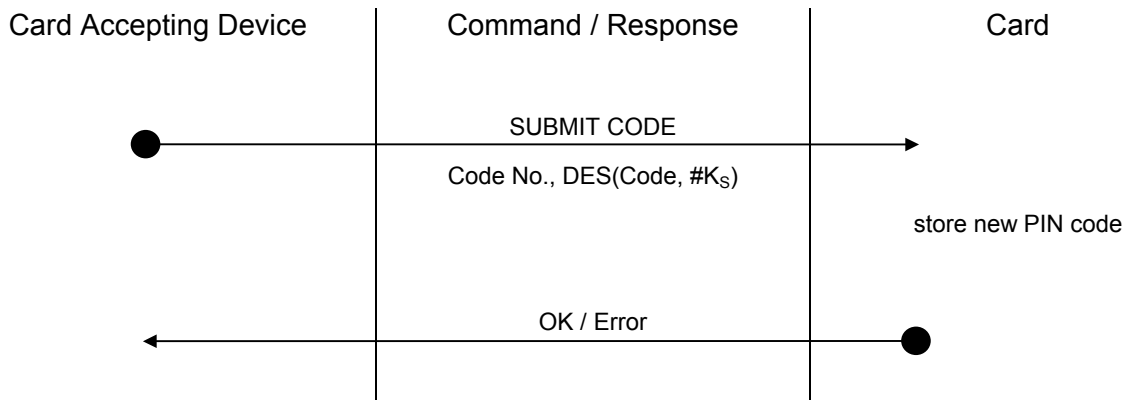

The PIN is eight bytes long. The PIN is presented to the card with the SUBMIT CODE command. Depending on the corresponding option bit PIN\_DES in the Security Option Register, the PIN is DES encrypted with the current session key before the presentation to the card, or it is presented in plain.

The PIN code can be changed with the CHANGE PIN command if setting the PIN\_ALT option bit in the option register has enabled this option. Depending on the option bit PIN\_DES, the new code is DES encrypted with the current session key before it is written to the card, or it is written in plain.

### 4.3.4 Secret Code Submission and Error Counters

Depending on the setting of the corresponding bit in the Security Option Register, a code is submitted to the card in plain or DES-encrypted with the current session key.

If the option bit xx\_DES for the code XX is set, the code is presented as follows:

NOTE: DES shall be 1-DES or 3-DES depending on selected *Option*

Code No.            Reference to the particular code that is submitted with the command:

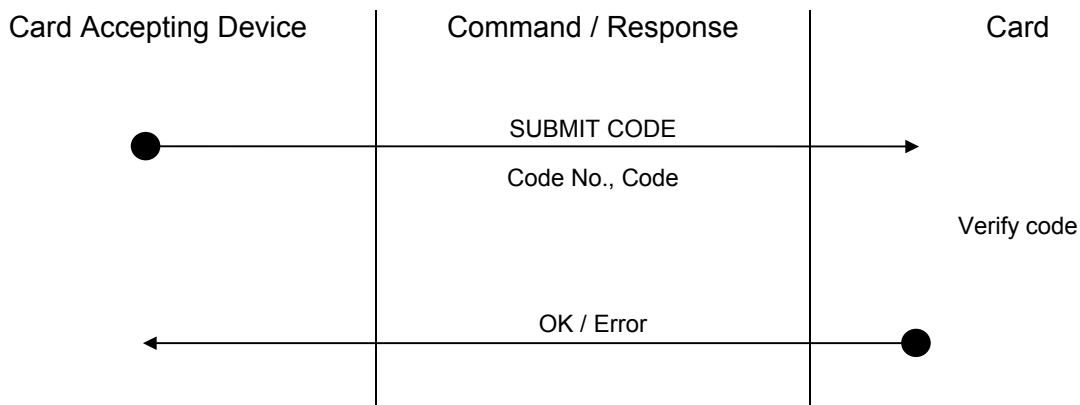

- 1 ... 5    =    Application Codes AC1...AC5
- 6         =    PIN
- 7         =    Issuer Code IC

Other values for *Code No.* are not allowed and will be rejected by the card.

Code                The eight bytes secret code to be submitted

$K_S$                       The current session key

If the option bit `xx_DES` is not set, the DES encryption of the code is not necessary and the code is submitted in plain:

**Code No.**                      Reference to the particular code that is submitted with the command:

- 1 ... 5    =    Application Codes AC1...AC5
- 6           =    PIN
- 7           =    Issuer Code IC

Other values for *Code Number* are not allowed and will be rejected by the card.

**Code**                              The eight bytes secret code to be submitted

The card maintains an error counter `CNT xx` for each secret code to count and limit the number of consecutive unsuccessful executions of the `SUBMIT CODE` command:

- The error counter for a particular code is incremented by one each time the `SUBMIT CODE` operation for that code fails, i.e., a wrong secret code is submitted to the card.
- The error counter for a particular secret code is reset when the `SUBMIT CODE` operation for that code has successfully been executed.
- If the error counter reaches a value of eight (8), the card will reject the command `SUBMIT CODE` for that code.

The error counters `CNT xx` are stored in the Security File. The counter value for a particular code is returned in the response by the card to an unsuccessful `SUBMIT CODE` operation.

A backup copy of all error counters is kept in the Security File to prevent a corruption of this important information if an update in progress is interrupted through a reset of the card.

#### 4.3.5 Change PIN code

The PIN code can be changed in the User stage with the command `CHANGE PIN` if the option bit `PIN_ALT` is set.

To program a new PIN code in the card, the current PIN code must have been submitted first.

For security reasons, the CHANGE PIN command can only be executed immediately after a Mutual Authentication process. No other command must have been executed between the Mutual Authentication and the CHANGE PIN command. Otherwise, the command is rejected.

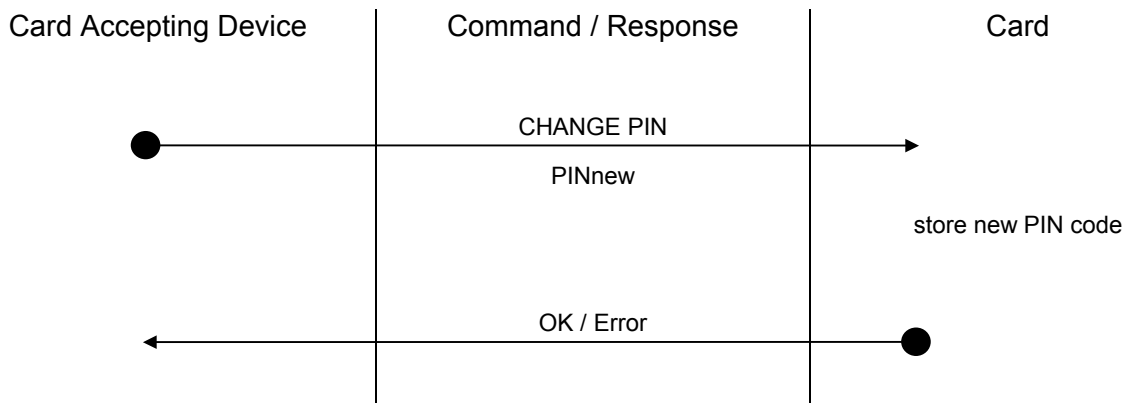

If the option bit PIN\_DES is set, the changing of the PIN code is carried out as follows:

NOTE: DES shall be 1-DES or 3-DES depending on selected *Option*

- PINnew      The new PIN code
- K<sub>S</sub>      The current session key

If the option bit PIN\_DES is not set, the DES<sup>-1</sup> encryption of the new PIN is not necessary and the changing of the PIN code is carried out as follows:

## 4.4 ACCOUNT TRANSACTION PROCESSING

Associated to the Account are four keys:

- The Credit Key  $K_{CR}$
- The Debit Key  $K_D$
- The Certify Key  $K_{CF}$
- The Revoke Debit Key  $K_{RD}$

The keys are stored in the Account Security File.

The keys are used in the calculation and verification of MAC cryptographic checksums on commands and data exchanged between the card and the Card Accepting Device in the Account processing.

All keys are 8 bytes long. The least significant bit of each byte of the keys is not used in the calculation and not interpreted by the card operating system.

Debit Key, Credit Key and Revoke Debit Key have each associated an error counter CNT  $K_{xx}$  to count and limit the number of consecutive unsuccessful executions of the transaction commands:

- The error counter for a key is incremented by one each time a command using the key fails due to a wrong key used by the Card Accepting Device.
- The error counter is reset when a command using the key is successful.
- If the error counter of a command reaches a value of eight (8), the card will reject any further commands using that key. This condition can only be reset by the execution of the CLEAR CARD command in the privileged Issuer mode, which erases all data in the card.

The error counters CNT  $K_{xx}$  for the transaction processing keys are stored in the normal Security File. Backup copies of the error counters are maintained by the operating system to prevent a loss of this important information if an update in progress is interrupted by a card reset.

Four different transaction types can be executed on the Account Data Structure under security conditions:

- INQUIRE ACCOUNT
- DEBIT
- REVOKE DEBIT
- CREDIT

The Account Data Structure can be read as a record oriented file in the Manufacturing Stage, in the Personalization Stage and in the User Stage after presentation of the Issuer Code IC. In the normal User Stage, a WRITE access to the Account is possible only through the special Account processing commands. WRITE RECORD access is possible after presentation of the Issuer Code IC.

As an additional security feature for very security critical applications, the option bits TRNS\_AUT and INQ\_AUT in the Options Register allow to link the Account Processing to the Mutual Authentication.

If the option bit TRNS\_AUT is set, the CREDIT, DEBIT and REVOKE DEBIT commands are executed by the card only after a successful completion of the Mutual Authentication. Furthermore, the MAC cryptographic checksum used to prove the authenticity and integrity of the respective command is encrypted with the current Session Key before it is transmitted to the card.

If the option bit INQ\_AUT is set, the INQUIRE ACCOUNT command can be executed only after a successful completion of the Mutual Authentication and the MAC cryptographic checksum returned by the card to prove the integrity and authenticity of the account data is encrypted with the current Session Key.

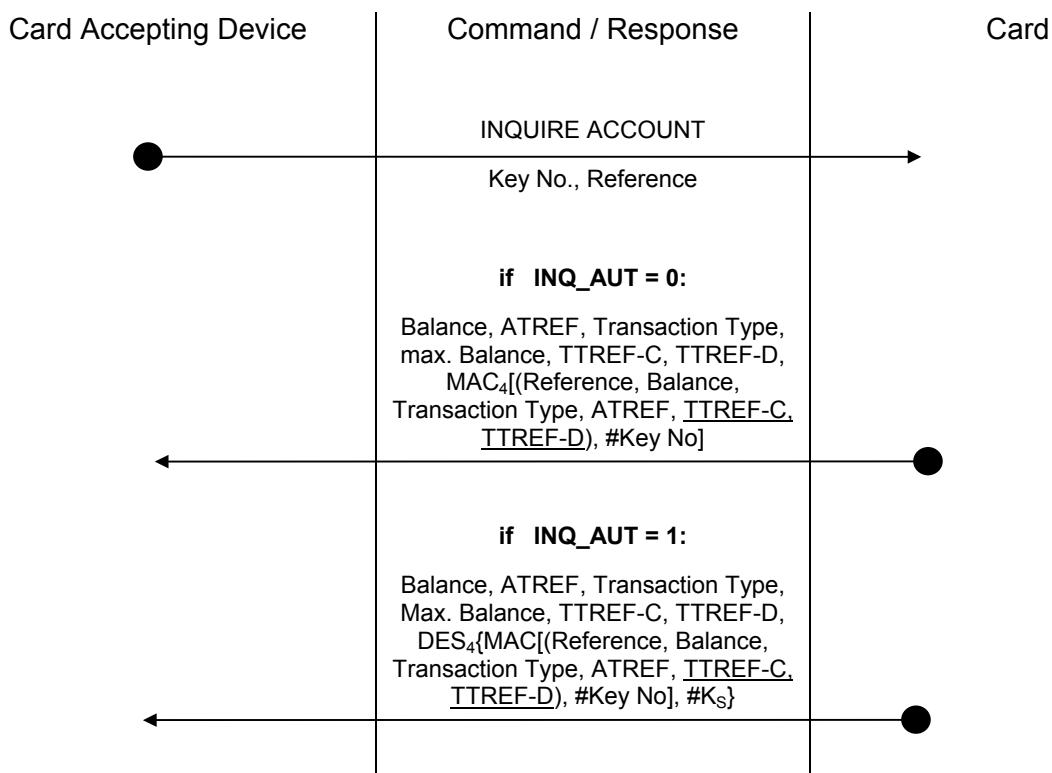

### 4.4.1 INQUIRE ACCOUNT

In the INQUIRE ACCOUNT transaction, the card returns the current balance value together with other relevant account information and a MAC cryptographic checksum on the relevant data. This signature can be regarded as a certificate issued by the card on the current balance and on the immediately preceding transaction. The key to be used in the generation of the MAC cryptographic checksum can be specified.

To prevent a replay of the response from a previous INQUIRE ACCOUNT command, the card-accepting device can pass a reference value to the card to be included in the MAC calculation.

If the option bit INQ\_AUT is set, the Mutual Authentication process must have been completed prior to the execution of the INQUIRE ACCOUNT command.

The INQUIRE ACCOUNT transaction is carried out as follows:

**Note :** Underlined fields are included only when the INQ\_ACC\_MAC flag in the Manufacturer File is equal to one.

NOTE: DES shall be 1-DES or 3-DES depending on selected *Option*

- Reference      Four (4) bytes reference value supplied by the card-accepting device to be included in the calculation of the MAC cryptographic checksum
- Key No.        Reference to the Account key to be used in the calculation of the MAC cryptographic checksum:
  - 0 = Debit Key  $K_{D1}$
  - 1 = Credit Key  $K_{CR}$
  - 2 = Certify Key  $K_{CF}$
  - 3 = Revoke Debit Key  $K_{RD}$

Other values are not permitted and will be rejected by the card.
- Balance        Current balance value
- ATREF         Account Transaction Reference of last transaction
- Transaction Type    One byte specifying the type of the last transaction performed on the Account:
  - 1 = DEBIT
  - 2 = REVOKE DEBIT
  - 3 = CREDIT
- Max. Balance    The maximum allowed balance value in the card
- TTREF-C        Terminal Transaction Reference of the last CREDIT transaction
- TTREF-D        Terminal Transaction Reference of the last DEBIT transaction
- MAC<sub>4</sub>         The first 4 bytes of MAC cryptographic checksum using the key specified by *Key No.*
- DES<sub>4</sub>         The first 4 bytes of the MAC cryptographic checksum using the key specified by *Key No.*, encrypted with the current Session Key  $K_S$ .

If INQ\_ACC\_MAC flag in Manufacturer file is zero, the first two blocks (16 bytes) will be used to calculate the MAC cryptographic checksum. If INQ\_ACC\_MAC flag is one, all three blocks (24 bytes) will be used to calculate the MAC cryptographic checksum.

**NOTE: ACS writes The INQ\_ACC\_MAC flag before the devices are being shipped. It is not changeable by the card issuer.**

#### 4.4.2 DEBIT

In a DEBIT transaction, the balance in the Account is decreased by the specified amount. The maximum amount that can be debited to the Account is the current balance value. Negative balance values are not allowed.

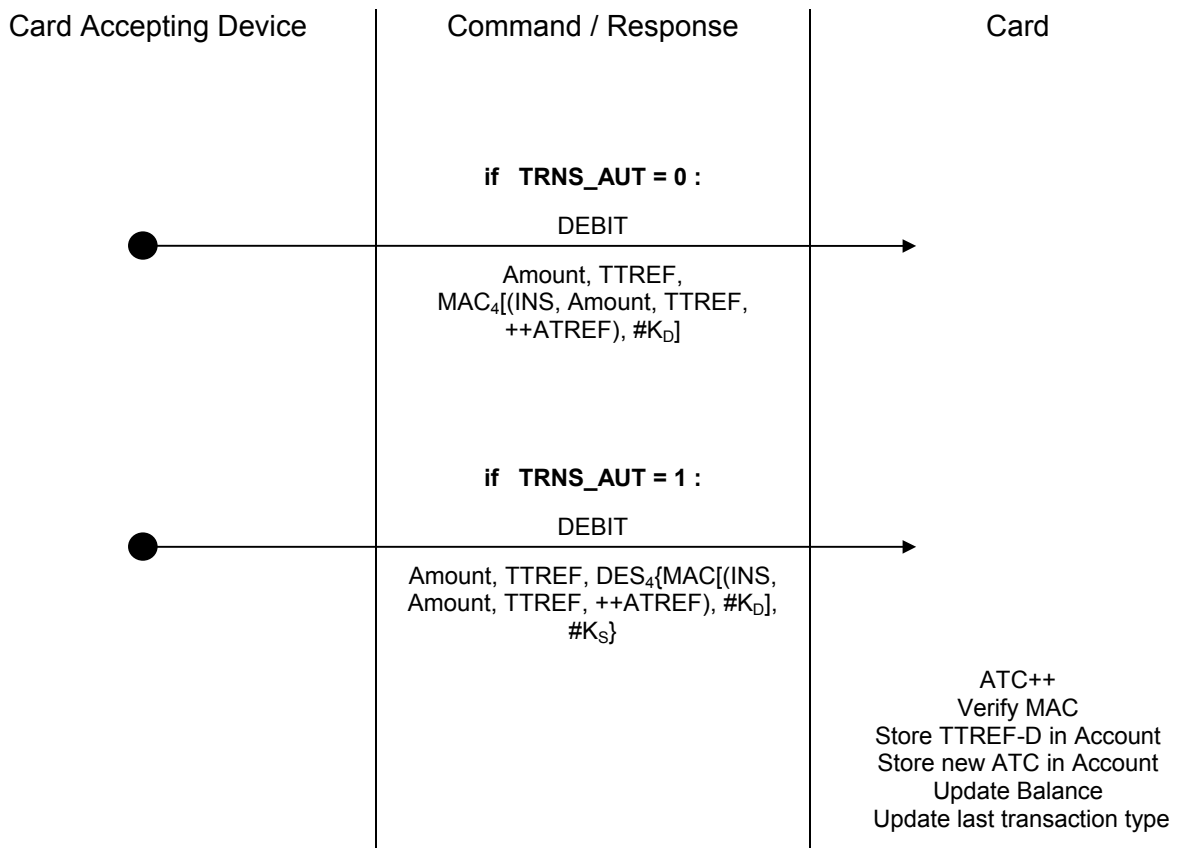

Different security conditions can be specified for the DEBIT transaction to allow for different security requirements. The security conditions for the DEBIT transaction are specified in the DEB\_MAC and DEB\_PIN option bits in the options register.

Proper setting of these option bits can specify four different security conditions:

DEB_MAC	DEB_PIN	Security Condition
0	0	no security checking; the DEBIT transaction can always be executed
0	1	the PIN code must have been submitted to the card prior to the execution of the DEBIT transaction
1	0	the MAC cryptographic checksum is required with the DEBIT transaction
1	1	the MAC cryptographic checksum with the DEBIT transaction is required <b>and</b> the PIN code must have been submitted to the card

If the option bit TRNS\_AUT is set, the Mutual Authentication process must have been completed prior to the execution of the DEBIT command.

The DEBIT transaction is carried out as follows:

NOTE: DES shall be 1-DES or 3-DES depending on selected *Option*

- TTREF            Terminal Transaction Reference for this DEBIT transaction
- ++ATREF        Account Transaction Reference for this transaction;
- INS             ACOS2 instruction code for DEBIT command
- Amount         Amount to be debited to the Account
- K<sub>D</sub>            Debit Key
- MAC<sub>4</sub>         The first 4 bytes of a MAC cryptographic checksum using K<sub>D</sub> as the key.
- DES<sub>4</sub>         The first 4 bytes of (MAC cryptographic checksum using K<sub>D</sub>, encrypted with the current Session Key K<sub>S</sub>.)

**Note:** The transaction counter in the card is incremented before the transaction is being executed!

The sixteen bytes data string on which the MAC cryptographic checksum is calculated is composed as follows:

1st block				2nd block			
byte 1		byte 8	byte 1		byte 8		
E6 <sub>hex</sub>	Amount	TTREF-D	ATREF	00	00		

If the option bit DEB\_MAC is not set, the 4 bytes of MAC cryptographic checksum must be transmitted in the command to the card but they are not evaluated by the operating system. The card will accept any value transmitted.

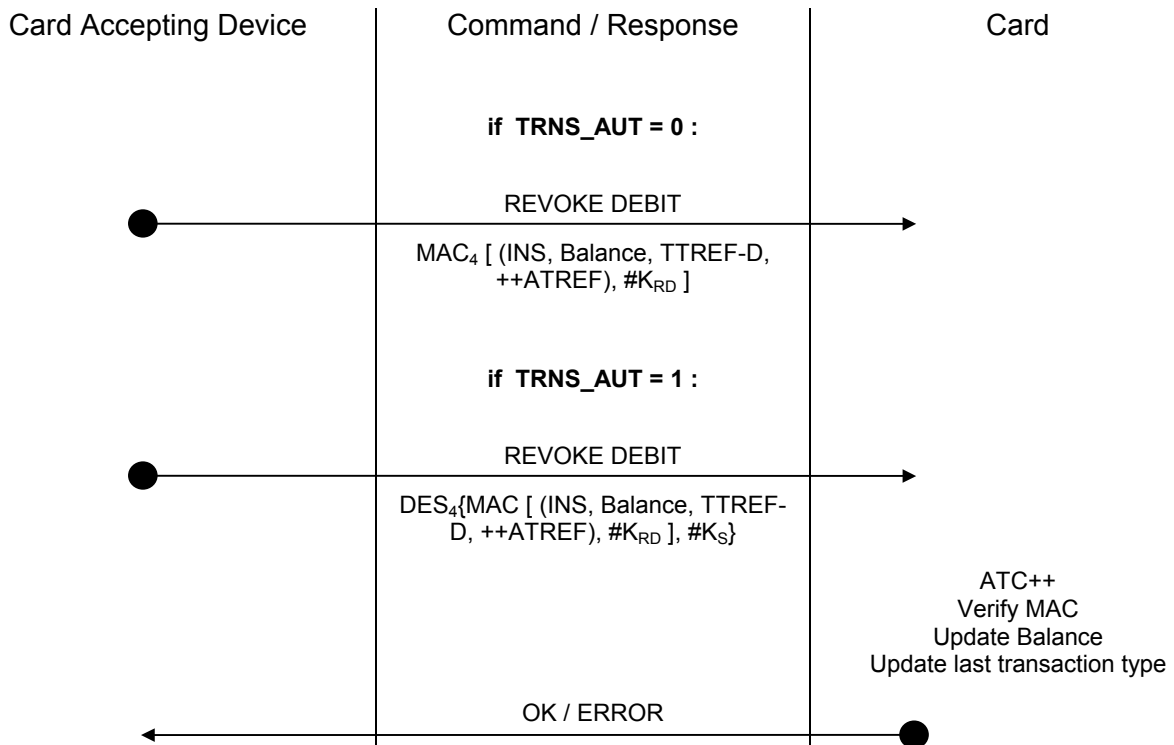

### 4.4.3 REVOKE DEBIT

A REVOKE DEBIT is only possible after a DEBIT transaction and applies always to the immediately preceding DEBIT transaction. The REVOKE DEBIT transaction can be executed to annul a DEBIT transaction, for example, if the amount debited was found wrong later on. As a result of the transaction, the balance value that was valid before the last DEBIT transaction is restored.

The REVOKE DEBIT transaction is enabled and disabled by the option bit REV\_DEB in the option register.

If the option bit TRNS\_AUT is set, the Mutual Authentication process must have been completed prior to the execution of the REVOKE DEBIT command.

The REVOKE DEBIT transaction is carried out as follows:

NOTE: DES shall be 1-DES or 3-DES depending on selected *Option*

- INS ACOS2 instruction code for REVOKE DEBIT command
- Balance Balance value to be restored (= balance before the preceding DEBIT transaction)
- TTREF-D Terminal Transaction Reference used in the preceding DEBIT transaction
- ++ATREF Account Transaction Reference for this transaction;
- K<sub>RD</sub> REVOKE DEBIT key
- MAC<sub>4</sub> The first 4 bytes of a MAC cryptographic checksum using K<sub>RD</sub> as the key.
- DES<sub>4</sub> The first 4 bytes of (MAC cryptographic checksum using K<sub>RD</sub>, encrypted with the current Session Key K<sub>S</sub>.)

**Note:** The transaction counter in the card is incremented before the transaction is being executed!

The sixteen bytes data string on which the MAC cryptographic checksum is calculated is composed as follows:

1st block				2nd block			
byte 1	byte 8			byte 1	byte 8		
E8 <sub>hex</sub>	Balance	TTREF-D	ATREF	00	00		

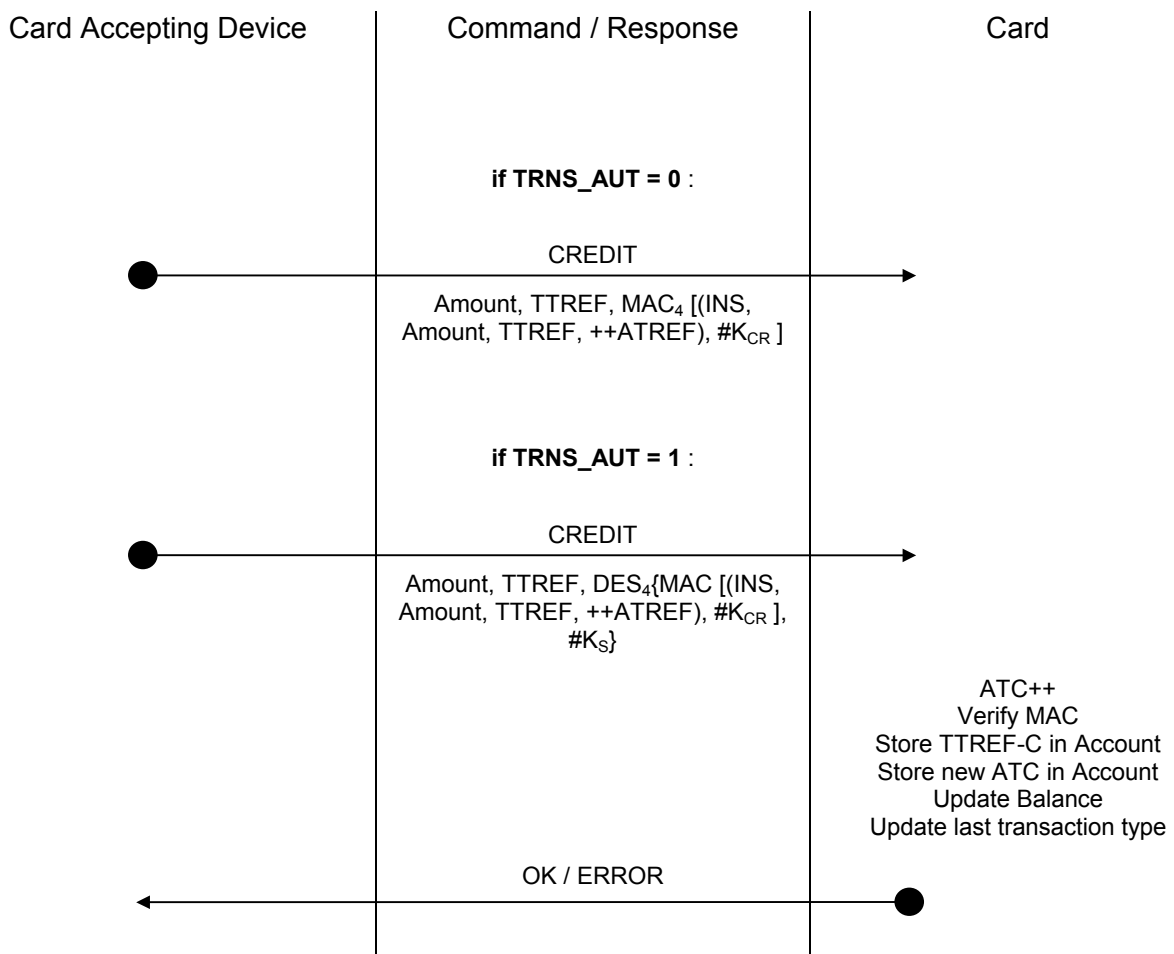

### 4.4.4 CREDIT

In a CREDIT transaction, the balance in the Account is increased by the specified amount. The maximum allowed the new balance must not exceed balance value MAXBAL as stored in the Account Data Structure. Otherwise, the card will reject the CREDIT command.

The CREDIT transaction is always carried out under high security processing.

If the option bit TRNS\_AUT is set, the Mutual Authentication process must have been completed prior to the execution of the CREDIT command.

The CREDIT transaction is carried out as follows:

NOTE: DES shall be 1-DES or 3-DES depending on selected *Option*

- TTREF            Terminal Transaction Reference for this CREDIT transaction
- ++ATREF        Account Transaction Reference for this transaction;
- INS             ACOS2 instruction code for CREDIT command
- Amount         Amount to be credited to the Account
- K<sub>CR</sub>            CREDIT key
- MAC<sub>4</sub>          The first 4 bytes of a MAC cryptographic checksum using K<sub>CR</sub> as the key.

DES<sub>4</sub> First four bytes of (MAC cryptographic checksum using  $K_{CR}$ , encrypted with the current Session Key  $K_S$ .)

**Note:** The transaction counter in the card is incremented before the transaction is being executed!

The sixteen bytes data string on which the MAC cryptographic checksum is calculated is composed as follows:

1st block				2nd block			
byte 1	byte 8			byte 1	byte 8		
E2 <sub>HEX</sub>	Amount	TTREF-C		ATREF		00	00

## 5. ISO COMPLIANCE AND ANSWER-TO-RESET

After a hardware reset (e.g., power up), the card transmits an Answer-To-Reset (ATR) in compliance with the standard ISO 7816, part 3. ACOS2 supports the protocol type T=0. The protocol type selection function is not implemented.

The direct convention is used for the coding of the bits in the communication with the card, i.e., logic level ONE corresponds to the Z state of the I/O line.

Fourteen bytes of data are transmitted in the historical characters, as described below.

The following data are transmitted in the ATR:

TS	T0	TA <sub>1</sub>	TB <sub>1</sub>	TD <sub>1</sub>	14 Historical Characters
3B <sub>H</sub>	BE <sub>H</sub>	11 <sub>H</sub>	00 <sub>H</sub>	00 <sub>H</sub>	

The 14 bytes string transmitted in the Historical Characters is composed as follows:

T1	T2	T3	T4	T5	T6	T7	T8	T9	T10	T11	T12	T13	T14
41 <sub>H</sub>	01 <sub>H</sub>	10 <sub>H</sub> /20 <sub>H</sub>	Option registers			Personalization File bytes 4 - 8					Life-cycle Stage	90 <sub>H</sub>	00 <sub>H</sub>

**Lifecycle Stage** Codes the current card lifecycle stage in a single byte

- 0 : User Stage
- 1 : Manufacturing Stage
- 2 : Personalization Stage

**Version Bytes** The contents of the version bytes are:

- T1 = 41<sub>H</sub> = ACOS
- T2 = 01<sub>H</sub> = Version 1
- T3 = 10<sub>H</sub> / 20<sub>H</sub> / 38<sub>H</sub> = Revision 1.0 / Revision 2.0 / Revision 3.8

**Option Registers** The contents of the three bytes option registers:

- T4 = Option Register
- T5 = Security Option Register
- T6 = N\_OF\_FILE

**Personalization File EEPROM memory** 5 bytes following the Option Registers of the Personalization File in the EEPROM memory

## 6. COMMANDS

The following section describes in detail the format of all ACOS2 commands and the possible responses.

The command descriptions use the TPDU representation. All numeric values are given in HEX.

A summary of the status codes returned by the card is given in 8. *STATUS CODES*.

The following commands are provided by ACOS2:

START SESSION	Start the Mutual Authentication Process
AUTHENTICATE	Authenticate the Card Accepting Device, authenticate the card and compute the Session Key
SUBMIT CODE	Submit a secret code
SELECT FILE	Select a data file for reading and writing
READ RECORD	Read data from a record of the currently open data file
WRITE RECORD	Write data to a record of the currently open data file
INQUIRE ACCOUNT	Read the balance and other Account information
CREDIT	Credit the Account
DEBIT	Debit the Account
REVOKE DEBIT	Revoke the preceding Debit transaction
CHANGE PIN	Change the PIN secret code
GET RESPONSE	Get response data available in the card

## 6.1 START SESSION

To read a random number from the card and start the mutual authentication process the result of which is the Session Key  $K_S$ .

### Command:

CLA	INS	P1	P2	P3
80	84	00	00	08

### Response:

Data	SW1 SW2
$RND_C$	Status

$RND_C$       Eight bytes card random number

### Status Codes:

SW1	SW2	Meaning
69	83	Terminal Authentication Key $K_T$ is locked, authentication process cannot be executed

## 6.2 AUTHENTICATE

To submit the encrypted random number to the card and initiate the computation of the session key.

### Command:

CLA	INS	P1	P2	P3	DATA	
80	82	00	00	10	DES(RND <sub>C</sub> , #K <sub>T</sub> )	RND <sub>T</sub>

DES(RND<sub>C</sub>, #K<sub>T</sub>) Eight bytes card random number DES-encrypted with Terminal Key K<sub>T</sub>

RND<sub>T</sub> Eight bytes terminal random number

NOTE: DES shall be 1-DES or 3-DES depending on the selection in *Option Register*

### Response:

SW1	SW2
Status	

### Specific Status Codes:

SW1	SW2	Meaning
69	85	START SESSION not executed immediately before AUTHENTICATE command
63	Cn	Key K <sub>T</sub> not correct; n = remaining number of re-tries
61	08	Issue GET RESPONSE with P3 = 8 to get the encrypted terminal random number

To get the response, execute the GET RESPONSE command:

### Command:

CLA	INS	P1	P2	P3
80	C0	00	00	08

### Response:

Data	SW1 SW2
DES(RND <sub>T</sub> , #K <sub>S</sub> )	Status

DES(RND<sub>T</sub>, #K<sub>S</sub>) Eight bytes terminal random number RND<sub>T</sub> DES-encrypted with Session Key K<sub>S</sub>

NOTE: DES shall be 1-DES or 3-DES depending on the selection in *Option Register*

**Specific Status Codes:**

SW1	SW2	Meaning
69	85	AUTHENTICATE not executed prior to the GET RESPONSE command

### 6.3 SUBMIT CODE

To submit a secret code - Application Code, PIN or Issuer Code - to the card.

#### Command:

CLA	INS	P1	P2	P3	DATA
80	20	Code No.	00	08	Code or DES(Code, #K <sub>S</sub> )

Code No.                    Code reference:            1...5 = AC1...AC5  
     6     = PIN  
     7     = IC

Code                        Eight bytes Code

DES(Code, #K<sub>S</sub>)        Eight bytes Code encrypted with Session Key

**NOTE:** If the corresponding option bit **xx\_DES** in the Security Option Register is set, code **XX** is submitted DES encrypted. If the option bit is not set, the code is submitted in plain without encryption.

NOTE: DES shall be 1-DES or 3-DES depending on the selection in *Option Register*

#### Response:

SW1	SW2
Status	

#### Specific Status Codes:

SW1	SW2	Meaning
63	Cn	Wrong Code; n = remaining number of re-tries
69	83	The specified Code is locked
69	85	Mutual Authentication not successfully completed prior to the SUBMIT CODE command

## 6.4 **SELECT FILE**

To select a data file for subsequent READ RECORD and WRITE RECORD commands.

### Command:

CLA	INS	P1	P2	P3	DATA
80	A4	00	00	02	File ID

File ID      Two bytes file identifier

### Response:

SW1	SW2
Status	

### Specific Status Codes:

SW1	SW2	Meaning
6A	82	File does not exist
91	xx	File selected (only for User Data Files) xx is the number of the record in the User File Management File (file ID: FF 04 <sub>H</sub> ) which contains the File Definition Block of the selected file

## 6.5 READ RECORD

To read a number of bytes - up to the record length - from one record in the currently selected file.

### Command:

CLA	INS	P1	P2	P3
80	B2	Rec No.	00	Len

Rec No. Logical record number to be read.  
 0..N-1 if RECORD\_NUMBERING flag in Manufacturer file is zero  
 1..N if RECORD\_NUMBERING flag in Manufacturer file is one

Len Number of data bytes to be read from the record Rec No.

**NOTE: ACS writes The RECORD\_NUMBERING flag before the devices are being shipped. The issuer cannot change it!**

### Response:

Data	SW1 SW2
Byte 1 ... Byte N	Status

Byte 1 ... Byte N Data bytes read from the record

### Specific Status Codes:

SW1	SW2	Meaning
69	82	Security status not satisfied - Secret code(s) not submitted
6A	83	Record not found - file too short
67	00	Specified Len is larger than record length or larger than 32 - invalid
69	85	No file selected

## 6.6 WRITE RECORD

To write a number of bytes - up to the record length - to one record in the currently selected file.

### Command:

CLA	INS	P1	P2	P3	DATA
80	D2	Rec No.	00	Len	Byte 1 ... Byte N

Rec No. Logical record number to be read.  
 0..N-1 if RECORD\_NUMBERING flag in Manufacturer file is zero  
 1..N if RECORD\_NUMBERING flag in Manufacture file is one

Len Number of data bytes to be written to the record *Rec No.*

Byte 1 ... Byte N Data bytes to be written to the first *Len* bytes of the record

**NOTE: The RECORD\_NUMBERING flag is written by ACS before the devices are being shipped. It cannot be changed by the issuer!**

### Response:

SW1	SW2
Status	

### Specific Status Codes:

SW1	SW2	Meaning
69	82	Security status not satisfied - Secret code(s) not submitted
6A	83	Record not found - file too short
67	00	Specified Len is larger than record length - invalid
69	85	No file selected

## 6.7 CREDIT

To credit the Account.

### Command:

CLA	INS	P1	P2	P3	DATA
80	E2	00	00	0B	MAC : Amount : TTREF

MAC Four bytes MAC cryptographic checksum on the command

Amount Three bytes value of amount to be credited

TTREF Four bytes Terminal Transaction Reference.

### Response:

SW1	SW2
Status	

### Specific Status Codes:

SW1	SW2	Meaning
69	F0	Data in account is inconsistent - no access unless in Issuer Mode
6A	82	Account does not exist
6F	10	Account Transaction Counter at maximum - no more transaction possible
63	Cn	MAC cryptographic checksum is wrong n = remaining number of retries
6B	20	Amount too large
69	83	Credit Key locked
69	85	Mutual Authentication has not been completed

## 6.8 DEBIT

To debit the Account.

### Command:

CLA	INS	P1	P2	P3	DATA
80	E6	00	00	0B	MAC : Amount : TTREF

MAC Four bytes MAC cryptographic checksum on the command

Amount Three bytes value of amount to be debited

TTREF Four bytes Terminal Transaction Reference.

### Response:

SW1	SW2
Status	

### Specific Status Codes:

SW1	SW2	Meaning
69	F0	Data in account is inconsistent - no access unless in Issuer Mode
6A	82	Account does not exist
6F	10	Account Transaction Counter at maximum - no more transaction possible
63	Cn	MAC cryptographic checksum is wrong n = remaining number of retries
69	82	Security status not satisfied - PIN not submitted
6B	20	Amount too large
69	82	PIN not submitted
69	83	Debit Key locked
69	85	Mutual Authentication has not been completed

## 6.9 REVOKE DEBIT

To revoke the most recent Debit command.

### Command:

CLA	INS	P1	P2	P3	DATA
80	E8	00	00	04	MAC

MAC Four bytes MAC cryptographic checksum on Balance, TTREF-D, ATREF

### Response:

SW1	SW2
Status	

### Specific Status Codes:

SW1	SW2	Meaning
69	F0	Data in account is inconsistent - no access unless in Issuer Mode
6A	82	Account does not exist
6F	10	Account Transaction Counter at maximum - no more transaction possible
63	Cn	MAC cryptographic checksum is wrong n = remaining number of re-retries
6A	82	Account does not exist
69	F0	Data in account is inconsistent - no access unless in Issuer Mode
69	66	Command not available (option bit not set)
69	85	
69	83	Revoke Debit Key locked
69	85	Preceding transaction was not DEBIT or Mutual Authentication has not been completed

## 6.10 INQUIRE ACCOUNT

To read the relevant information from the Account,

### Command:

CLA	INS	P1	P2	P3	DATA
80	E4	Key No.	00	04	Reference

**Key No.** Reference to the key to be used in the calculation of the MAC cryptographic checksum

**Reference** Four bytes arbitrary reference data

### Response:

SW1	SW2
Status	

### Specific Status Codes:

SW1	SW2	Meaning
6A	86	Key No. invalid
69	85	Mutual Authentication has not been completed
61	19	Issue GET RESPONSE with P3 = 19

To get the response, execute the GET RESPONSE command:

### Command:

CLA	INS	P1	P2	P3
80	C0	00	00	19

### Response:

Data							SW1 SW2
MAC4	Trans. Type	Balance	ATREF	max. Balance	TTREF-C	TTREF-D	Status

**MAC4** First 4 bytes of MAC cryptographic checksum on the account data and the reference

**Trans. Type** One byte coding the type of the most recent transaction

Balance        Three bytes current balance value  
ATREF         Six bytes Account Transaction Reference  
max. Balance Three bytes maximum allowed balance value  
TTREF-C       Four bytes Terminal Transaction Reference - Credit  
TTREF-D       Four bytes Terminal Transaction Reference - Debit

**Specific Status Codes:**

SW1	SW2	Meaning
69	85	No data available; the INQUIRE ACCOUNT command was not executed immediately prior to the GET RESPONSE command
62	81	Account data may be corrupted

## 6.11 CHANGE PIN

To set a new PIN code in the card.

### Command:

CLA	INS	P1	P2	P3	DATA
80	24	00	00	08	PIN or DES <sup>-1</sup> (PINnew, #K <sub>S</sub> )

PINnew            New PIN

Ks                Session Key

**NOTE:** If the option bit PIN\_DES is 0, the PIN code is not DES encrypted with K<sub>S</sub>!

NOTE: DES shall be 1-DES or 3-DES depending on the selection in *Option Register*

### Response:

SW1	SW2
Status	

### Specific Status Codes:

SW1	SW2	Meaning
69	82	PIN not submitted prior to issuing this command
69	85	Mutual Authentication not completed immediately prior to this command
69	66	Command not available; option bit not set

## 6.12 GET RESPONSE

To retrieve the response data to an APDU case 4 command (incoming and outgoing data).

### Command:

CLA	INS	P1	P2	P3
80	C0	00	00	Len

Len            The expected response data length

### Response:

SW1	SW2
Status	

### Specific Status Codes:

SW1	SW2	Meaning
90	00	O.K.
6C	nn	Wrong expected data length - issue command again with P3 = nn
69	85	No data available
62	81	Part of the data may be corrupted

The GET RESPONSE command must be issued **immediately** after the successful execution of any one of the following commands:

Command	Len
AUTHENTICATE	8
INQUIRE ACCOUNT	19 <sub>H</sub>

## 7 CARD PERSONALIZATION

This section describes the general procedure in the personalization of an ACOS2 smart card. While the card personalization may be carried out in separate processing steps, the personalization process generally requires the execution of the steps described below.

The personalization of a new ACOS2 smart card is suggested to be carried out according to the following sequence:

- 1) Power up and reset the card
- 2) Submit the default Issuer Code IC (the code is communicated to the card issuer by ACS; the code may be different for different batches of cards supplied)
- 3) Select the Personalization File (File ID = FF 02<sub>H</sub>) and write the required settings to the *Option Register* and the parameter N\_OF\_FILE. **Caution: Do not accidentally set the Personalization Bit and do not change the Security Option Register at this stage!**
- 4) Perform a card reset. After the reset, ACOS2 reads the Personalization File and accepts the new value of N\_OF\_FILE and the option bits stored in the *Option Register*.
- 5) Submit the default Issuer Code IC.
- 6) Select the User File Management File (File ID = FF 04<sub>H</sub>) and write the File Definition Blocks for the required User Files (WRITE RECORD command) with the security attributes set to 'Free Access'.
- 7) Select the individual User Files and initialize the data in the files as required (WRITE RECORD command).
- 8) Select the User File Management File (File ID = FF 04<sub>H</sub>) and write the required security attributes for all User Files (WRITE RECORD command). Verify the contents of the User File Management File (READ RECORD command). **Caution: Do not accidentally change the other parameters in the File Definition Blocks.**
- 9) If applicable, select the Account File (File ID = FF 05<sub>H</sub>) and initialize the relevant data in the Account File (WRITE RECORD command). Verify the contents of the Account File (READ RECORD command).
- 10) If applicable, select the Account Security File (File ID = FF 06<sub>H</sub>) and initialize the account processing keys (WRITE RECORD command). Verify the contents of the Account Security File (READ RECORD command).
- 11) Select the Security File (File ID = FF 03<sub>H</sub>) and initialize all keys and codes (WRITE RECORD command). Verify the contents of the Security File (READ RECORD command)
- 12) Select the Personalization File (File ID = FF 02<sub>H</sub>) and initialize the *Security Option Register* and the remaining bytes of the Personalization File. **Set the Personalization Bit** (WRITE RECORD command). Verify the contents of the Personalization File (READ RECORD command). **Caution: Do not accidentally change the value of the Option Register and N\_OF\_FILE.**
- 13) Perform a card reset. The chip life cycle stage as indicated in the ATR should be 'User Stage'.
- 14) The correct personalization can be verified by submitting the secret codes and keys programmed in the card (AUTHENTICATE, SUBMIT CODE commands) and reading/writing the allocated data files and executing the Account commands.

## 8 STATUS CODES

The following is a summary of the status codes returned by the card.

SW1	SW2	Meaning
90	00	O.K.
91	nn	User Data File has been selected. The corresponding File Definition Block is stored in record no. nn in the File Management File
61	nn	O.K. - Issue GET RESPONSE command with L <sub>e</sub> = nn to get response data
62	81	Data returned in response to the INQUIRE ACCOUNT command may be incorrect due to corrupted data in the Account Data Structure
63	Cn	Security related command failed - EXTERNAL AUTHENTICATION failed; incorrect Secret Code submitted; incorrect key used in CREDIT MAC generation; n = number of remaining trials
67	00	Wrong P3
69	66	Command not available (Manufacturing Stage, option bit not set, etc.)
69	82	Security status not satisfied - Secret Code, Issuer Code or PIN not submitted
69	83	Key or Secret Code is locked - no more verification or submission possible
69	85	Conditions of use not satisfied - no data for GET RESPONSE command available; CREDIT/DEBIT command executed without previous START TRANSACTION; Mutual Authentication not completed; no file selected
69	F0	Account data inconsistent / transaction interrupted - access to account only in privileged mode possible
6A	82	File does not exist; account not available
6A	83	Record not found - file too short
6A	86	P1-P2 incorrect
6B	20	Invalid amount in CREDIT/DEBIT command
6C	nn	Issue GET RESPONSE command with P3 = nn to get response data
6D	00	Unknown INS
6E	00	Invalid CLA
6F	10	Account Transaction Counter at maximum - no more DEBIT or CREDIT transaction possible
